Product Requirements Document

& AI Prompt Specification

India's First AI-Powered Curated Hospitality Ecosystem

Document Version	1.0 — Enhanced PRD
Classification	Confidential — Internal Use
Prepared For	Design, Development & Product Teams
Prepared By	DhyanaStays Product Team
Date	June 27, 2026
Status	Implementation Ready

Table of Contents

PART A — PLATFORM VISION & IDENTITY

- Section 01 — Platform Overview & Brand Identity
- Section 02 — Hero Section
- Section 03 — Problem Statement
- Section 04 — Proposed Solution
- Section 05 — Mission, Vision & Core Values

PART B — ECOSYSTEM & BUSINESS MODEL

- Section 06 — Ecosystem Architecture
- Section 07 — Business Model & Revenue Streams
- Section 08 — Investor Opportunity Module

PART C — USER JOURNEYS

- Section 09 — Traveller Experience Journey
- Section 10 — Property Owner Journey
- Section 11 — Investor Journey

PART D — PRODUCT FEATURES

- Section 12 — AI-Powered Features
- Section 13 — Current Platform Features
- Section 14 — Upcoming / Roadmap Features

PART E — TECHNOLOGY & OPERATIONS

- Section 15 — Technology Stack
- Section 16 — Product Roadmap (Phases 1–3)

PART F — IMPACT, POSITIONING & GROWTH

- Section 17 — Social & Community Impact
- Section 18 — Competitive Differentiators
- Section 19 — Statistics & KPI Dashboard

PART G — WEBSITE DESIGN & ENGAGEMENT

- Section 20 — Join the Movement — CTA Module
- Section 21 — Contact, Footer & Newsletter
- Section 22 — Website Design Requirements

PART H — GOVERNANCE

- Section 23 — Non-Functional Requirements
- Section 24 — Security, Privacy & Compliance
- Section 25 — Glossary & Appendix

1.1 Overview

DhyanaStays is a technology-enabled hospitality company that builds and operates India's first AI-powered curated stay ecosystem. It is not a traditional hotel booking platform. Instead, it functions as an end-to-end intelligent travel ecosystem that unifies accommodation, AI-driven itinerary planning, local experiences, food, transport, events, and investor-backed property development into a single, seamless platform.

The platform serves four primary stakeholder groups — Travellers, Investors, Property Owners, and Local Communities — while simultaneously functioning as a marketplace, a SaaS product, a property development company, and a community-building initiative.

1.2 Purpose of This Document

This document serves as the official Product Requirements Document (PRD) and AI Prompt Specification for DhyanaStays. It is intended to be the single source of truth for all design, development, and product decisions. Every module is documented with functional detail sufficient for developers to begin implementation without ambiguity.

1.3 Brand Identity

Brand Name	Dhyana Stays
Domain	DhyanaStays.com
Tagline	Experience Beyond Stay
Category	AI-Powered Curated Hospitality Ecosystem
Target Market	India (primary); international expansion in Phase 3
Design Reference	Apple + Airbnb + Tesla + Notion — premium, minimalist, cinematic
Tone of Voice	Aspirational, warm, intelligent, community-first, story-driven
Primary Colours	Deep Navy, Warm Gold, Calm Teal, Clean White
Typography	Modern sans-serif — clean, generous leading, strong hierarchy

1.4 Design Philosophy

"The website should not look like a traditional hotel booking website. It should feel like the beginning of a movement that is redefining tourism. Focus on storytelling instead of selling."

- Emotion-first design: Every section must communicate a feeling before communicating a feature.
- Cinematic storytelling: Large imagery, video backgrounds, parallax, and smooth transitions replace conventional grids.
- Premium white space: Content is never crowded. Breathing room signals quality.
- Glassmorphism: Frosted-glass UI elements used for cards, modals, and overlays.
- Dark & Light mode: Full support with seamless toggle, no visual degradation in either mode.
- Micro-interactions: Buttons, cards, and icons respond to hover, focus, and tap with subtle animations.
- Mobile-first responsiveness: Every layout, animation, and interaction is designed for mobile before desktop.

■ AI Development Prompt — Platform Overview & Brand Identity

■ Context & Purpose

- Build the foundational identity layer of DhyanaStays as an AI-powered hospitality ecosystem.
- This is NOT a hotel booking site. The platform must feel like a movement, a vision, and a technology company.
- The brand should evoke trust, premium quality, community, and intelligent innovation simultaneously.

■ UI Expectations

- The global design system must include a Navy/Gold/Teal colour palette.
- Typography must use a modern, premium sans-serif with strong visual hierarchy (H1 > H2 > Body).
- All components must support Dark Mode and Light Mode with a persistent user preference stored in local storage.
- Glassmorphism effects (backdrop-filter: blur + semi-transparent backgrounds) must be used for cards, modals, and nav.
- Loading animation must reflect brand identity — not a generic spinner.

■ Business Rules

- The platform identity must always foreground the AI-powered and curated nature of stays.
- Never use transactional language ("Buy Now", "Cheap Stays") — use aspirational language.
- The brand voice must be consistent across all 21 website sections.

■ Permissions & Roles

- Brand guideline enforcement is the responsibility of the Product / Design Lead.
- No developer should alter brand tokens (colours, fonts, spacing) without approval.

■ Success Scenario

- A first-time visitor understands within 5 seconds that DhyanaStays is different from any booking platform they have used.
- The design immediately signals premium quality, technology, and community purpose.

■ Failure Scenario

- The site looks like a template-based travel portal.
- Colours are inconsistent between Dark and Light modes.
- The brand story is unclear or absent.

2.1 Overview

The Hero Section is the most critical section of the DhyanaStays website. It is the first visual and emotional experience a visitor has. It must immediately communicate the platform's unique position and compel the visitor to explore further.

2.2 Content Specification

Headline	Experience Beyond Stay
Sub-Headline	India's first AI-powered curated hospitality ecosystem connecting travellers, investors, property owners, and local communities.
Background	Cinematic drone video of curated stays surrounded by nature — autoplay, muted, looped, with a subtle dark overlay.
Overlay Text Colour	White with soft text-shadow for legibility over video.

2.3 CTA Buttons

- Explore Dhyana Stays — Primary CTA. Scrolls to the platform overview or opens the booking section.
- Become an Investor — Secondary CTA. Scrolls to Investor Opportunity section or opens an investor enquiry form.
- Join Our Mission — Tertiary CTA. Scrolls to the Join the Movement section.

2.4 Functional Description

- The hero video must autoplay on all devices where autoplay is permitted; fallback to a high-quality static image on restricted browsers.
- The video must loop seamlessly with no visible stutter.
- A subtle dark gradient overlay (bottom-to-top) must ensure text legibility at all times.
- The three CTAs must be visually distinct: Primary = solid gold/teal button; Secondary = outlined; Tertiary = text link.
- On mobile, the sub-headline font size must reduce gracefully without breaking layout.
- A scroll-down indicator (animated arrow or chevron) must appear at the bottom of the hero.
- The headline must animate in using a cinematic fade-up or reveal effect on page load.

2.5 System Workflow

1. Browser requests page → Server delivers HTML/CSS/JS bundle.
2. Hero video src is loaded asynchronously. A static poster image is shown during video load.
3. Once video is buffered (`readyState >= 3`), the video replaces the poster image.
4. Headline and sub-headline animate in using CSS keyframe animations (delay: 300ms, 600ms respectively).
5. CTAs fade in at 900ms after page load.
6. Scroll position listener activates the sticky navigation bar once the user scrolls past the hero.

2.6 Business Rules

- The headline copy ("Experience Beyond Stay") must never be altered without brand approval.
- All three CTA buttons must always be visible on first render without scrolling.
- The video content must always depict natural, curated, premium environments — never generic stock footage.
- The video must include a poster fallback for slow connections.

2.7 Validation & Error Handling

- If the video fails to load, the poster image displays automatically. No error message is shown to the user.
- If autoplay is blocked by the browser, the poster image remains and a muted play button appears.
- CTA buttons must be keyboard-accessible with visible focus states.
- Hero section must pass WCAG 2.1 AA contrast ratio (4.5:1) for all text over video.

2.8 Dependencies

- Video CDN or media hosting service (Cloudflare Stream, Mux, or equivalent).
- CSS animation library (GSAP or native CSS keyframes).
- Intersection Observer API for scroll-based nav activation.

■ AI Development Prompt — Hero Section

■ Objective

- Build a full-viewport cinematic hero section that is the emotional and visual entry point of DhyanaStays.
- The section must communicate the brand's premium, AI-powered, community-driven identity within the first 5 seconds of a user's visit.

■ UI Expectations

- Full-viewport height (100vh) with no scrollbar visible on initial load.
- Drone video background: autoplay, muted, looped; dark overlay gradient (rgba 0,0,0,0.45).
- Headline: Large (72px desktop, 40px mobile), bold, white, centred, animated fade-up on load.
- Sub-headline: 18px desktop, 15px mobile, light grey-white, centred, delayed animation.
- Three CTAs: horizontally arranged on desktop, stacked on mobile with 12px gap.
- Primary CTA: solid TEAL or GOLD background, white text, rounded corners, hover scale effect.
- Secondary CTA: outlined white border, white text, hover fill effect.
- Tertiary CTA: plain text with underline on hover.

- Animated scroll indicator at bottom centre (bouncing arrow or chevron).

■ API / System Behavior

- Video must be loaded asynchronously — do not block page render.
- Poster image (high-resolution static drone photo) must be set as the video poster attribute.
- Detect autoplay capability; fallback gracefully if blocked.
- Implement Intersection Observer to trigger sticky navbar background once hero exits viewport.

■ Error Handling

- Video load failure → show poster image silently, no error UI.
- Slow connection → show poster image; add loading spinner in bottom-right corner of hero only.
- CTA click with no internet → queue the scroll action locally; no network dependency for scroll CTAs.

■ Accessibility

- All text must meet WCAG 2.1 AA contrast ratio over the video overlay.
- Video must have `aria-hidden="true"` — it is decorative.
- All CTAs must have descriptive `aria-label` attributes.
- Reduce-motion media query must disable all animations for users who prefer reduced motion.

■ Success Scenario

- User lands on page → video plays immediately → headline animates in → user feels awe, curiosity, and premium quality.
- User clicks "Explore Dhyana Stays" → smooth scroll to Section 1 (What is Dhyana Stays).

■ Failure Scenario

- Video does not play and no fallback image appears — blank background.
- CTAs are not visible without scrolling on mobile.
- Headline text is unreadable due to insufficient overlay darkness.

3.1 Overview

This section visually communicates the core pain point that DhyanaStays is solving: the extreme fragmentation of the modern travel experience. A traveller today must navigate up to 10 or more disconnected applications and platforms to complete a single trip.

3.2 Problem Description

Current travel is fragmented. Travellers are forced to juggle multiple disconnected platforms just to plan, book, and enjoy a single trip. There is no single intelligent system that unifies the entire travel lifecycle from inspiration to memory-sharing.

3.3 Fragmented Platform Journey (Visual Flow)

The following represents the typical traveller's app-switching journey:

1	Booking Website	Search and reserve accommodation
2	Google Maps	Navigate to property and explore surroundings
3	Instagram / YouTube	Discover experiences, food spots, and hidden gems
4	Restaurant Apps	Discover, reserve, and pay for meals
5	Transport Apps	Book cabs, auto-rickshaws, or bike rentals
6	Event Websites	Find and book local events, workshops, festivals
7	Local Guides	Hire guides manually with no standardisation or reviews
8	Emergency Numbers	Search for local hospitals, police, or support contacts
9	Multiple Payment Gateways	Make separate transactions across each platform

3.4 Business Impact of Fragmentation

- Decision fatigue: Travellers spend more time managing apps than enjoying the journey.
- Missed experiences: Without an integrated discovery layer, travellers miss local gems, festivals, and authentic food.
- Trust deficit: No central quality control means inconsistent hospitality standards.

- Lost revenue for local communities: Businesses with no digital presence are bypassed entirely.
- Zero data continuity: No platform remembers a traveller's preferences, history, or loyalty.

3.5 Functional Requirements for Problem Visualisation

- The problem must be communicated through a visual diagram or animated infographic — not just text.
- Each app/platform in the fragmentation chain must be represented by a recognisable icon or label.
- Connecting arrows must show the chaotic, multi-step nature of the journey.
- A visual contrast must exist between the problem (fragmented) and the solution (unified).
- The visual must work in both Dark and Light modes.

■ AI Development Prompt — Problem Statement Module

■ Objective

- Build an animated, visually engaging "Problem Statement" section that communicates the fragmented travel experience.
- The visitor should feel the pain of juggling 9+ apps before the solution (Dhyana Stays) is revealed.

■ UI Expectations

- Animated vertical flow diagram showing 9 disconnected platforms with icons and labels.
- Each step should animate in sequentially (staggered, 150ms apart) as the user scrolls into the section.
- Use a chaotic visual aesthetic for the problem side — multiple colours, arrows crossing, visual clutter.
- Add a visual "chaos score" or connection count badge (e.g., "9 apps. 9 payments. 1 trip.") as a summary callout.
- Section background: light grey or off-white in light mode; deep charcoal in dark mode.
- Transition at the end of this section should feel like a "breath of fresh air" — dramatic contrast into the Solution section.

■ Animations

- On scroll-enter: Platforms fade/slide in one by one from top.
- Connecting arrows draw themselves in using SVG stroke-dashoffset animation.
- A visual "break/shatter" effect or dissolve transitions into the Solution section.

■ Accessibility

- The diagram must have a text alternative (screen-reader-only list) describing each step.
- Animation must respect prefers-reduced-motion — replace with static diagram if enabled.

■ Success Scenario

- User scrolls through the problem section and visually understands the fragmentation before seeing the solution.
- The emotional response is frustration with the status quo — which amplifies the relief of the solution.

■ Failure Scenario

- The problem section is text-only and users skip it without understanding the contrast.
- Animations are too slow or jittery on mobile devices.

4.1 Overview

The Solution section directly follows the Problem section and presents DhyanaStays as the definitive answer to travel fragmentation. It introduces the concept of a unified, intelligent platform where every travel need is addressed without switching apps.

4.2 Solution Components

✦	Booking	Discover, compare, and reserve curated stays directly on the platform.
✦	AI Trip Planner	Generate personalised itineraries based on travel dates, preferences, budget, and weather.
✦	Curated Experiences	Browse and book authentic local experiences curated by community partners.
✦	Local Food	Discover and order from vetted local restaurants and cloud kitchens.
✦	Transport	Book taxis, bikes, and airport transfers within the same app.
✦	Emergency SOS	One-tap access to emergency contacts, medical support, and police.
✦	Events	Discover and book local festivals, workshops, concerts, and community events.
✦	Investor Dashboard	Real-time portfolio performance, revenue analytics, and occupancy reports.
✦	Hospitality Management	Professional operations management for all partner properties.
✦	Property Management	End-to-end tools for property owners to manage listings, bookings, and guest communications.

4.3 Functional Description

- The solution section must visually contrast with the problem section — moving from chaos to clarity.
- Each solution component must be presented as an icon card with a label and brief description.
- An interactive element (hover/tap to expand) should allow users to learn more about each component.
- The section must culminate in a clear statement: "One App. Zero Friction. Infinite Experiences."

4.4 User Workflow

1. User arrives at the Solution section after experiencing the Problem section animation.
2. A headline contrasts the problem: "Now imagine — one platform that does it all."
3. Solution cards animate in using a grid reveal with staggered delay.
4. User hovers/taps a card to see an expanded tooltip or modal with feature details.
5. A "Explore the Platform" CTA button appears at the bottom of the section.

■ AI Development Prompt — Solution Section

■ Objective

- Build a visually dramatic "Our Solution" section that presents DhyanaStays as the antithesis of the fragmented travel experience.
- The transition from the Problem section to this section should feel like relief and clarity.

■ UI Expectations

- Solution grid: 2 or 3 columns on desktop, 1 column on mobile.
- Each card: Icon (Lottie animation or SVG), bold title, 1-line description.
- Card hover: Lift effect (translateY -4px, box-shadow increase), icon colour change to gold.
- Section background: Clean white in light mode, deep navy in dark mode.
- Headline: "One Ecosystem. One Application. Everything Inside Dhyana Stays." — large, centred, bold.
- CTA at bottom: "Start Exploring" — primary solid button.

■ Animations

- Cards animate in using a staggered grid reveal (100ms delay between each card).
- Lottie animations on icons play once on scroll-enter, then loop on hover.
- Section headline uses a character-by-character or word-by-word reveal animation.

■ Business Rules

- All 10 solution components must be visible without the user needing to scroll within the section on desktop.
- The section must not feel like a feature list — it must feel like a promise.

■ Success Scenario

- User understands that DhyanaStays replaces all the fragmented apps they currently use.
- The emotional journey goes: Frustration (Problem) → Relief (Solution) → Curiosity (CTA click).

5.1 Mission Statement

"To redefine hospitality through meaningful architecture, intelligent technology, and curated experiences while creating sustainable income opportunities for investors and local communities."

- **Redefine Hospitality:** Not just better stays — a completely new paradigm of what hospitality means.
- **Meaningful Architecture:** Spaces designed with intentionality, beauty, and sense of place.
- **Intelligent Technology:** AI as an enabler of personalisation, efficiency, and connection.
- **Curated Experiences:** Hand-selected, quality-controlled, authentic local experiences.
- **Sustainable Income:** Investors and communities benefit financially from every stay.

5.2 Vision Statement

"To become India's most trusted curated hospitality ecosystem and connect thousands of unique stays through one intelligent platform."

- **Most Trusted:** Trust is built through transparency, consistent quality, and community validation.
- **Curated:** Every property on the platform must meet DhyanaStays quality and design standards.
- **Thousands of Unique Stays:** Scale without compromising the curated, authentic character of each property.
- **One Intelligent Platform:** The vision is a unified, AI-driven ecosystem — not a marketplace.

5.3 Core Values

■ Authenticity

Every stay, experience, and interaction must be genuine and true to its local context. No manufactured or generic experiences.

■ Sustainability

Environmental, social, and economic sustainability must be embedded in every operational decision — from architecture to revenue sharing.

■ Innovation

Continuous improvement through AI, technology, and design thinking. DhyanaStays is a technology company first, a hospitality company second.

■ Community

Local communities are partners, not bystanders. Every platform decision must consider its impact on the communities where DhyanaStays operates.

■ Design Excellence

Aesthetic quality is non-negotiable. Every property, every page, every interaction must reflect thoughtful, intentional design.

■ Guest Happiness

The guest's joy, comfort, and memory-making are the ultimate measure of success. Every feature must be evaluated against this standard.

■ Trust

Investors, property owners, and guests must be able to trust DhyanaStays completely — with their money, their properties, and their experiences.

■ Transparency

Open and honest communication about financials, operations, and platform decisions across all stakeholder groups.

■ AI Development Prompt — Mission, Vision & Values Section

■ Objective

- Build a Mission, Vision, and Core Values section that communicates the philosophical depth and genuine purpose of DhyanaStays.
- This section must feel sincere, not corporate. It must speak to idealists, travellers, investors, and community builders alike.

■ UI Expectations

- Mission and Vision statements: Large, centred quote-style typography with a decorative left-bar or quotation mark.
- Core Values: Grid of 8 cards (2×4 on desktop, 1 column on mobile).
- Each value card: Icon (line-art or Lottie), bold title, 2-sentence description.
- Card hover: Gentle background colour shift to light teal/gold.
- Section background: Alternating bands — white, light grey — or a subtle gradient.

■ Business Rules

- Mission and Vision text must match exactly as specified — no paraphrasing in the UI.
- All 8 core values must be displayed. None may be hidden behind a "show more" interaction.
- Values must be listed in the prescribed order.

■ Success Scenario

- A potential investor or property owner reads this section and feels confident that DhyanaStays shares their values.
- A traveller reads this section and feels emotionally aligned with the platform before making a booking.

6.1 Overview

The Ecosystem section visually and interactively communicates the breadth and interconnectedness of the DhyanaStays platform. It is presented as an interactive circular diagram with DhyanaStays at the centre and all stakeholder and partner categories orbiting around it.

6.2 Ecosystem Participants

■ Core Platform

- DhyanaStays (Hub)

■ Demand Side

- Travellers
- Corporate Retreat Clients
- Event Attendees

■ Supply Side

- Property Owners
- Architects
- Hospitality Partners

■ Experience Layer

- Restaurants
- Event Planners
- Tour Guides
- Workshop Facilitators

■ Mobility Layer

- Taxi Operators
- Bike Rental Partners
- Airport Transfer Services

■ Investment Layer

- Individual Investors
- Institutional Investors
- Property Developers

■ Community Layer

- Local Businesses

- Communities
- Artisans
- Volunteer Networks

6.3 Functional Description

- The diagram must be interactive — clicking/tapping on any node reveals a tooltip or sidebar with a description of that stakeholder's role.
- Concentric circles represent layers: Core (Dhyana Stays) → Primary Stakeholders → Secondary Participants → Community.
- Connecting lines between nodes animate on hover to show the relationship/data flow between groups.
- On mobile, the circular diagram adapts to a vertical accordion list.
- In Dark mode, node labels use white text; in Light mode, navy text.

6.4 Business Rules

- DhyanaStays must always occupy the exact centre of the diagram.
- All 12+ ecosystem participants listed in the specification must appear in the diagram.
- No single stakeholder group may be visually larger than DhyanaStays at the centre.
- The diagram must communicate interconnection — not just a list of participants.

■ AI Development Prompt — Ecosystem Architecture Section

■ Objective

- Build an interactive circular ecosystem diagram that visualises all DhyanaStays stakeholders and their interconnections.
- The diagram must function as both an explanatory tool and a visual centrepiece of the website.

■ UI Expectations

- SVG-based or Canvas-based circular diagram — centred on the page.
- DhyanaStays node: Largest, centre, navy background with white logo.
- Stakeholder nodes: Sized by proximity/importance; colour-coded by category (Demand/Supply/Experience/Mobility/Investment/Community).
- Connection lines: Semi-transparent, animated on hover to show data/value flow direction.
- Tooltip on node click/hover: Card with node name, role description, and a "Learn More" link.
- Mobile fallback: Vertical accordion list with expand/collapse per category.

■ System Behavior

- All nodes must be clickable/tappable with a 44×44px minimum touch target.
- Tooltip must close when user clicks outside it.
- Diagram must scale responsively — use SVG viewBox for fluid scaling.
- Lottie animation can be used for the connecting lines to create a "pulse" effect.

■ Accessibility

- Diagram must have a full text-alternative list of all nodes for screen readers.
- Keyboard navigation must allow Tab-through of all nodes with Enter to expand tooltip.

■ Success Scenario

— User interacts with the ecosystem diagram and understands the full scope of the DhyanaStays platform in under 2 minutes.

7.1 Overview

DhyanaStays operates a diversified, multi-revenue-stream business model that derives income from platform transactions, property operations, technology services, and ecosystem partnerships. This section documents each revenue stream with its functional description, business rules, and expected system behaviour.

7.2 Revenue Streams

1. Booking Commission

Description	A percentage commission charged on every successful booking made through the platform. Rate varies by property tier and partnership agreement.
Commission / Fee Rate	8%–15% per booking
Settlement Rule	Commission calculated at checkout; transferred to platform wallet after guest check-in confirmation.

2. Hospitality Management Fee

Description	DhyanaStays provides professional hospitality management for investor-owned and partner properties. A monthly management fee is charged.
Commission / Fee Rate	Fixed monthly + performance bonus
Settlement Rule	Fee auto-deducted from property revenue before distribution to owner/investor.

3. Property Development Revenue

Description	DhyanaStays co-develops or fully develops properties in partnership with investors. Revenue generated from construction margin and long-term operations.
Commission / Fee Rate	Project-based
Settlement Rule	Governed by individual investor agreements; tracked in the Investor Dashboard.

4. Architecture Consultation

Description	DhyanaStays provides architecture and interior design services to property owners seeking to list on the platform.
Commission / Fee Rate	Project-based fee

Settlement Rule	Invoiced separately from platform operations.
-----------------	---

5. Experience Marketplace Commission

Description	Commission on all experience bookings (tours, workshops, events) made through the platform.
Commission / Fee Rate	10%–20% per booking
Settlement Rule	Distributed to experience provider after deducting platform commission.

6. Event Booking Commission

Description	Revenue from events listed and sold through the DhyanaStays platform.
Commission / Fee Rate	10%–15% per ticket
Settlement Rule	Ticket revenue held in escrow until event completion.

7. Food Commission

Description	Commission charged to restaurant and cloud kitchen partners for orders placed through the platform.
Commission / Fee Rate	12%–18% per order
Settlement Rule	Integrated with payment gateway; commission auto-deducted.

8. Transport Commission

Description	Revenue from taxi, bike rental, and airport transfer bookings.
Commission / Fee Rate	10%–15% per booking
Settlement Rule	Commission withheld at time of booking confirmation.

9. SaaS Licensing (Future)

Description	Future revenue stream: Licensing the DhyanaStays platform technology to other hospitality operators.
Commission / Fee Rate	Subscription-based
Settlement Rule	Available from Phase 3 onwards.

10. AI Services (Future)

Description	Monetisation of the AI Trip Planner and recommendation engine as a standalone service for other platforms.
Commission / Fee Rate	API-usage-based pricing
Settlement Rule	Available from Phase 3 onwards.

7.3 Financial Business Rules

- All revenue calculations must be automated — no manual commission calculations.
- Every transaction must generate an immutable audit log entry.
- Revenue splits between DhyanaStays, property owners, and investors must be enforced programmatically.
- Tax deduction (TDS) must be calculated and displayed separately for applicable transaction types.
- All financial dashboards must refresh in real-time (or near-real-time, max 15-minute delay).
- Refund and cancellation policies must be platform-defined per property tier and enforced at checkout.

■ AI Development Prompt — Business Model & Revenue Streams

■ Objective

- Build a Business Model section that transparently communicates how DhyanaStays generates revenue and creates value for all stakeholders.
- The section must build investor and partner confidence, not just inform travellers.

■ UI Expectations

- Revenue stream cards: Grid of 2 or 3 columns on desktop; each card shows stream name, description, and commission range.
- A visual pie chart or donut chart showing projected revenue distribution across streams.
- An animated "value flow" diagram showing how money flows between Travellers → Platform → Investors → Community.
- A "Model Transparency" badge: "Every transaction is tracked and reported in real-time."

■ System / API Behavior

- Commission rates must be stored in a central configuration table, not hard-coded in UI.
- All financial transactions must pass through a payment gateway with webhook confirmation before revenue distribution.
- Revenue dashboards must pull from a read-only analytics database replica to ensure performance.

■ Business Rules

- Commission rates displayed on the website must match the rates stored in the system configuration.
- No revenue stream may be added or modified without a change control process.
- SaaS and AI services streams must be labelled as "Coming in Phase 3" until available.

■ Success Scenario

- An investor viewing this section understands clearly how their capital generates returns and how the platform earns revenue alongside them.

8.1 Overview

The Investor Opportunity module is one of the most business-critical sections of the DhyanaStays platform. It must attract, educate, and convert potential investors into active partners. The module presents the investment model, revenue sharing structure, operational transparency, and exit strategy in a clear, compelling format.

8.2 Investment Model

Revenue Sharing Model	50% — Investor 50% — DhyanaStays Operations
Operational Management	Professional hospitality management by DhyanaStays on behalf of investor
Reporting Frequency	Monthly revenue and occupancy dashboard
Analytics Provided	Revenue per available room (RevPAR), occupancy rate, booking trends, guest reviews
Accounting	Transparent, auditable, digitally accessible accounting for every property
Property Appreciation	Long-term capital appreciation of the underlying real estate asset
Exit Strategy	Defined exit options: property resale, platform buyback, or partner transfer
Investment Scalability	Investors may invest in multiple units across the portfolio

8.3 Investor Dashboard — Functional Requirements

- Real-time occupancy rate for each invested property.
- Monthly and cumulative revenue summary with trend charts.
- Booking calendar with confirmed, pending, and blocked dates.
- Revenue distribution history with itemised deductions (commission, tax, management fee).
- Downloadable monthly financial statements (PDF format).
- Guest review summary and property performance score.
- Upcoming maintenance or renovation alerts.
- Comparison view: Actual performance vs. projected performance.
- Exit strategy simulator: Estimated property valuation and return on investment at different time horizons.
- Notification centre: Revenue disbursement alerts, booking milestones, occupancy alerts.

8.4 User Workflow

1. Investor discovers DhyanaStays via website, referral, or marketing campaign.
2. Investor clicks "Become an Investor" CTA → directed to an investor enquiry form.
3. DhyanaStays team contacts investor to discuss available properties and investment tiers.
4. Investor receives a detailed Investment Deck (PDF) with property projections.
5. Investor signs digital agreement via the platform.
6. Investor gains access to the Investor Dashboard upon agreement execution.
7. Monthly automated revenue reports and disbursements are processed by the platform.
8. Investor can view real-time performance data and download statements at any time.

8.5 Business Rules

- Revenue distribution must occur within 5 business days of month-end closing.
- No investor may access another investor's property data — strict data isolation per user.
- The 50:50 revenue split is the default model; custom splits require contract-level configuration.
- All investment agreements must be executed digitally with OTP or digital signature verification.
- Financial data in the dashboard must be updated no later than 24 hours after each transaction.
- Investors must receive an automated SMS and email notification upon each revenue disbursement.

8.6 Validation Rules

- Investor enquiry form: All fields (name, email, phone, investment budget, location preference) are mandatory.
- Email must follow standard format; phone must be validated for Indian format (+91 prefix).
- Investment budget must be a numeric value above a defined minimum threshold.
- Digital agreement requires identity verification (Aadhaar or PAN in Indian regulatory context).

8.7 Error Handling

- If dashboard data fails to load → show "Data temporarily unavailable. Please refresh." with a retry button.
- If revenue disbursement fails → trigger automated alert to finance team; investor receives "processing delay" notification.
- If investor tries to access another investor's property → system returns 403 Forbidden; no data leakage.
- If form submission fails → preserve entered data in local storage; show error toast with retry option.

■ AI Development Prompt — Investor Opportunity Module

■ Objective

— Build an investor-facing module that educates, builds confidence, and converts potential investors into DhyanaStays partners.

— The module must present the investment model clearly, transparently, and compellingly.

■ UI Expectations

— Hero callout: "Become part of India's next-generation hospitality ecosystem." — large, bold, teal background.

— Investment model: Visual 50/50 split diagram (pie or split card).

— Dashboard preview: A mockup or animated preview of the Investor Dashboard.

- Benefits grid: 4-column (desktop), 2-column (mobile) — each benefit as an icon + title + 1-line description.
- CTA: "Register Your Interest" → opens an investor enquiry modal.

■ API / System Behavior (Investor Dashboard)

- Dashboard must be behind authentication — accessible only after login.
- Data must be fetched from a secure analytics API with role-based access control (RBAC).
- Revenue charts must support date range filters (7 days, 30 days, 3 months, 12 months, custom).
- All financial data must be encrypted in transit (TLS 1.3) and at rest (AES-256).

■ Permissions

- Investor role: Read-only access to their own property data and financial reports.
- Finance Admin role: Read/write access to revenue distribution records.
- Super Admin: Full access to all investor data and configuration.

■ Validation Rules

- Investor enquiry form: All fields mandatory; real-time validation on blur.
- Phone: Indian format validation; Email: RFC 5322 format.
- Investment budget: Minimum INR 10 lakhs (or as defined by business); numeric only.

■ Success Scenario

- An investor submits the enquiry form → receives a confirmation email within 2 minutes → is contacted by DhyanaStays team within 24 hours.
- Existing investor logs in → sees real-time dashboard with revenue, occupancy, and booking data.

■ Failure Scenario

- Dashboard shows stale data older than 24 hours without a clear "last updated" indicator.
- Revenue disbursement is processed without an investor notification.
- Two investors can see each other's data due to missing RBAC enforcement.

9.1 Overview

The Traveller Experience Journey documents the complete lifecycle of a traveller on the DhyanaStays platform — from initial discovery to post-trip memory sharing. Every touchpoint in this journey must be seamless, delightful, and AI-enhanced.

9.2 Journey Stages

Stage 1. Search

Action	Traveller searches for stays by destination, date, budget, experience type, or mood.
System Response	AI-powered search with natural language support; filters for property type, amenities, experience categories.

Stage 2. Book

Action	Traveller selects a property and completes booking with secure payment.
System Response	Real-time availability calendar; instant booking or request-to-book; multiple payment methods.

Stage 3. AI Itinerary

Action	Platform generates a personalised trip itinerary based on travel dates, preferences, and local context.
System Response	AI Trip Planner generates day-by-day schedule; user can edit, save, and share itinerary.

Stage 4. Transportation

Action	Traveller books transport from their origin to the property and for local travel.
System Response	In-platform booking for cabs, bikes, and airport transfers; confirmed with driver details.

Stage 5. Check-in

Action	Digital or in-person check-in process upon arrival at the property.
System Response	QR code check-in; smart lock integration (future); digital welcome guide delivered on check-in.

Stage 6. Digital Guide

Action	An in-app digital guide provides everything the traveller needs during their stay.
System Response	Property manual, Wi-Fi, local recommendations, emergency contacts, transport schedules.

Stage 7. Explore

Action	Traveller discovers and books local experiences, tours, and workshops through the app.
System Response	Real-time availability; in-app booking and payment; rated by previous guests.

Stage 8. Food

Action	Traveller orders food from curated local restaurants or the property's cloud kitchen.
System Response	In-app menu, ordering, and payment; estimated delivery time displayed.

Stage 9. Events

Action	Traveller discovers and attends local events during their stay.
System Response	Event calendar with filters by category, date, and distance from property.

Stage 10. SOS Support

Action	Traveller can access emergency support with a single tap at any time during their stay.
System Response	Pre-configured emergency contacts (hospital, police, property host); one-tap call or message.

Stage 11. Rewards

Action	Traveller earns reward points for every booking, experience, and referral.
System Response	Points accumulate in a loyalty wallet; redeemable on future bookings or experiences.

Stage 12. Share Memories

Action	Traveller shares their experience on the platform and/or social media.
System Response	In-app review submission; social sharing with branded DhyanaStays frame; memory journal feature.

9.3 Business Rules

- Every traveller must create an account before completing a booking.
- Booking confirmation must be sent via SMS and email within 60 seconds of payment success.
- Digital Guide must be available offline once downloaded — no internet required during stay.
- Reward points must be credited within 24 hours of check-out confirmation.

- SOS button must be functional even without internet via a fallback SMS mechanism.
- Guest reviews must be submitted within 7 days of check-out; after this window, the option expires.

■ AI Development Prompt — Traveller Experience Journey

■ Objective

- Build a visual, animated traveller journey section that communicates the seamless, AI-enhanced travel experience DhyanaStays provides.
- The journey must be presented as a story — not a feature checklist.

■ UI Expectations

- Horizontal timeline (desktop) or vertical stepper (mobile) showing all 12 journey stages.
- Each stage: Icon, stage name, 1-line description.
- Active stage (on scroll): Expands to show full description and a small UI preview mockup.
- Progress bar at top of timeline animates as user scrolls through stages.
- Section CTA: "Start Your Journey" → links to booking search.

■ System Behavior

- Search: Integrate with Elasticsearch or Algolia for real-time property search with faceted filters.
- Booking: Real-time availability check against property calendar before allowing booking confirmation.
- AI Itinerary: Generated server-side using the AI Trip Planner engine; returned as a structured day-by-day JSON object.
- SOS: Must trigger an emergency alert via SMS API (Twilio or AWS SNS) even without internet connectivity (via cached phone numbers).

■ Validation Rules

- Search: Destination field mandatory; dates mandatory and must be in the future.
- Booking: Check-in date must be before check-out date; minimum 1-night stay enforced.
- Review: Rating (1–5 stars) and at least one written sentence required for submission.

■ Error Handling

- Payment failure → Booking not confirmed; user notified with retry option; no amount deducted.
- AI Itinerary generation failure → fallback to a template itinerary with a "personalise later" prompt.
- SOS failure (no internet) → pre-cached emergency numbers displayed in offline mode.

■ Success Scenario

- Traveller completes all 12 journey stages within one DhyanaStays session — zero app-switching required.

10.1 Property Owner Journey

1. Own Property

Property owner has a land parcel, existing structure, or a property they wish to list on DhyanaStays.

2. Partner with Dhyana

Owner registers on the platform as a Property Partner and submits property details for evaluation.

3. Design

DhyanaStays architecture team reviews the property and proposes a design concept aligned with brand standards.

4. Construction / Renovation

Construction or renovation is carried out to DhyanaStays specifications. Owner may opt for DhyanaStays-managed construction.

5. Listing

Property is photographed, described, priced, and listed on the DhyanaStays platform.

6. Operations

DhyanaStays's hospitality management team takes over day-to-day operations.

7. Guest Management

Check-in, guest communication, housekeeping, and issue resolution handled by DhyanaStays.

8. Revenue

Monthly revenue distributed to property owner after platform commission deduction.

9. Reports

Property owner receives monthly occupancy and revenue reports via the Host Dashboard.

10.2 Property Owner — Functional Requirements

- Host Dashboard: Booking calendar, revenue summary, guest reviews, maintenance requests.
- Property submission form with photo upload (min. 10 photos), description, amenities checklist, and location map.
- Real-time notification for new bookings, guest check-ins, and reviews.

- Downloadable monthly revenue statement in PDF format.
- In-app messaging between property owner and DhyanaStays operations team.
- Property performance benchmarking against similar properties on the platform.

10.3 Business Rules — Property Owner

- A property must pass a DhyanaStays quality inspection before being listed.
- Property owners may not directly contact guests outside the platform — all communication must occur in-app.
- Revenue disbursement to property owner occurs within 5 business days of month-end.
- Property owners may pause listings temporarily with 48-hour advance notice.

10.4 Investor Journey (Summary)

The Investor Journey is documented in detail in Section 08. Key stages: Property Discovery → Enquiry → Agreement → Dashboard Access → Monthly Revenue → Reports → Exit Option.

■ AI Development Prompt — Property Owner Journey

■ Objective

- Build a Property Owner Journey section that converts property owners and land holders into DhyanaStays partners.
- The section must communicate the ease, professionalism, and financial benefit of partnering with DhyanaStays.

■ UI Expectations

- Vertical step-by-step journey timeline: 9 stages with icon, title, and description.
- Alternating left/right layout on desktop (zigzag), linear on mobile.
- Stage icons: Custom line-art or Lottie animations.
- CTA at bottom: "Partner With Us" → opens property submission form.

■ System Behavior

- Property submission form: Multi-step form with progress indicator (Step 1: Details, Step 2: Photos, Step 3: Location, Step 4: Review & Submit).
- Photo upload: Min 10 photos, max 50; 5MB per image; JPEG/PNG; client-side compression before upload.
- Location: Google Maps integration for pin-drop location selection.
- On submission: Auto-acknowledgement email sent within 2 minutes; DhyanaStays team review within 3 business days.

■ Validation Rules

- All mandatory fields in property submission form must be validated in real-time.
- At least 10 photos must be uploaded before form submission is allowed.
- Property must have a valid location pin before form submission.

■ Success Scenario

- Property owner completes submission → receives acknowledgement → DhyanaStays team contacts within 3 days → property is listed within 30 days.

12.1 Overview

Artificial intelligence is the core differentiator of DhyanaStays. The AI layer powers personalised recommendations, intelligent itinerary generation, predictive travel planning, and a future voice assistant. This section documents all AI features with their functional requirements, data inputs, expected outputs, and business rules.

12.2 AI Trip Planner

Feature Name	AI Trip Planner
Purpose	Generate a personalised, day-by-day travel itinerary based on traveller inputs
Inputs	Destination, travel dates, group size, budget, interests (adventure/culture/food/wellness), mobility constraints
Outputs	Structured day-by-day itinerary: time slots, activities, restaurants, transport, estimated costs
AI Method	Large language model (LLM) + recommendation engine; fine-tuned on curated local data
User Edit	Traveller can modify, remove, or add activities to the generated itinerary
Save & Share	Itinerary can be saved to user account and shared via link or PDF export
Offline Access	Saved itineraries must be accessible offline

12.3 Smart Itinerary Features

■ Weather Suggestions

AI adjusts itinerary recommendations based on real-time and forecasted weather data for the travel dates and destination.

■ Crowd Prediction

AI predicts peak and off-peak times for popular attractions and recommends visit times to avoid crowds.

■ Travel Time Optimisation

AI sequences activities to minimise travel time between locations, considering traffic patterns and transport options.

■ Budget Planning

AI provides estimated costs for each activity, meal, and transport segment; adjusts recommendations to match user budget.

■ Nearby Attractions

AI surfaces nearby attractions, hidden gems, and under-visited locations relevant to the traveller's interests.

■ Restaurant Suggestions

AI recommends curated local restaurants based on cuisine preference, dietary restrictions, price range, and proximity.

■ Festival Recommendations

AI identifies local festivals, cultural events, and seasonal activities happening during the travel dates.

■ Personal Travel Assistant

An in-app AI chatbot that answers travel questions, provides recommendations, and assists with bookings in natural language.

■ Voice Assistant (Future)

Hands-free voice control for the AI Trip Planner and in-stay digital guide — available from Phase 2/3.

■ Predictive Travel Planning (Future)

AI proactively suggests travel destinations based on the user's past behaviour, upcoming holidays, and seasonal trends.

12.4 AI System Architecture Requirements

- The AI engine must be accessible via a secure internal API endpoint — never exposed directly to the client.
- All AI requests must include a unique session identifier to maintain context across a conversation.
- AI responses must be generated within 3 seconds for standard itinerary requests; longer requests must show a loading indicator.
- AI recommendations must be explainable — each suggestion must include a brief reason (e.g., "Based on your interest in local culture...").
- All AI-generated content must be reviewed by the platform's content moderation system before delivery to the user.
- AI must gracefully degrade — if the AI service is unavailable, a rule-based recommendation system must serve as fallback.
- User interaction data (preferences, edits, ratings) must be fed back into the recommendation model for continuous improvement.

12.5 Business Rules

- AI itineraries must only recommend properties, experiences, restaurants, and activities that are active partners on the DhyanaStays platform.
- AI must never recommend or reference a competitor platform.

- Budget estimates provided by the AI must include a disclaimer: "Estimates are indicative and subject to availability and seasonal variation."
- Weather data must be sourced from a reliable weather API (OpenWeatherMap or IMD) and refreshed every 6 hours.

12.6 Error Handling

- AI generation timeout (>5 seconds): Show "Our AI is thinking... please wait" with an animated indicator; auto-retry once.
- AI service unavailable: Fall back to a curated template itinerary for the requested destination; notify user that personalisation is temporarily limited.
- Empty or invalid AI response: Log the error server-side; return a generic response with an option to "Try Again".
- Offensive or inappropriate AI output (caught by moderation): Suppress the output; log for review; serve fallback content.

■ AI Development Prompt — AI Trip Planner & Smart Features

■ Objective

- Build an AI-powered trip planning feature that generates personalised, actionable, day-by-day itineraries for DhyanaStays travellers.
- The AI must feel intelligent, contextual, and genuinely helpful — not a generic template generator.

■ Functional Requirements

- Multi-step input form: Destination, dates, group size, budget range, interests (multi-select), dietary restrictions, mobility needs.
- AI engine: LLM-based itinerary generation with local data enrichment (partners, events, weather).
- Output format: JSON with days, time_slots, activity_name, location, estimated_cost, booking_link, AI_reason fields.
- User editing: Drag-and-drop reordering of activities; replace activity button; add custom activity option.
- Save: Itinerary saved to user account; accessible under "My Trips" section.
- Share: Generate a shareable link; export as PDF with DhyanaStays branding.
- Offline: Saved itineraries cached using service worker for offline access.

■ API Behavior

- POST /api/v1/ai/itinerary — accepts input parameters, returns structured itinerary JSON.
- GET /api/v1/ai/itinerary/{id} — retrieves a saved itinerary by ID.
- PUT /api/v1/ai/itinerary/{id} — saves user edits to an itinerary.
- POST /api/v1/ai/chat — handles conversational AI assistant messages.
- All endpoints require authentication; rate limit: 10 itinerary generations per user per day.

■ Error Handling

- Timeout > 5s: Show animated "Our AI is crafting your journey..." state; auto-retry once.
- AI failure: Return HTTP 503; client shows fallback template itinerary for destination.
- No results: If AI cannot find enough data for destination → prompt user to broaden filters.

■ Success Scenario

- User enters travel details → AI generates a complete 3-day itinerary in under 3 seconds → User adjusts 2 activities → Saves and shares with travel companion.

13.1 Overview

This section documents all features that are live or in final development on the current DhyanaStays platform. These features form the foundation of the MVP (Minimum Viable Product) and must be fully functional, tested, and documented before public launch.

13.x Booking Engine

Core booking system allowing users to search, select, and reserve curated stays.

- Property search with destination, date, and guest filters.
- Real-time availability calendar.
- Booking request and instant booking modes.
- Booking confirmation via email and SMS.

13.x Direct Booking

Commission-free direct booking channel for returning guests and loyalty members.

- Unique direct booking URL per property.
- No OTA commission applied.
- Preferred pricing for direct bookers.

13.x Property Pages

Individual property listing pages with full details, photos, and booking capability.

- High-resolution photo gallery (min. 10 images; full-screen lightbox).
- Property description, amenities, house rules, and location map.
- Pricing calendar and availability display.
- Guest reviews and ratings section.
- Similar properties recommendation widget.

13.x Admin Dashboard

Internal operations dashboard for DhyanaStays staff to manage all platform activity.

- User management (guests, hosts, investors).

- Booking management (view, confirm, cancel, modify).
- Property listing approval and management.
- Revenue and occupancy analytics.
- Content management (blog, experiences, events).

13.x Host Dashboard

Self-service dashboard for property owners to manage their listings and track performance.

- Booking calendar with confirmed, pending, and blocked dates.
- Revenue summary and monthly statements.
- Guest communication centre.
- Maintenance request submission.
- Property listing edit capability.

13.x Investor Dashboard

Performance and financial dashboard for investors — detailed in Section 08.

- Real-time occupancy and revenue metrics.
- Monthly financial statements.
- Booking calendar view.
- Property performance benchmarking.

13.x Secure Payments

PCI-DSS compliant payment processing for all transactions.

- Multiple payment methods: UPI, cards (Visa/Mastercard/RuPay), net banking, wallets.
- Payment gateway: Razorpay or equivalent.
- Secure tokenisation of card data.
- Automated refund processing for cancellations.

13.x Booking Calendar

Visual availability calendar for properties, accessible to hosts, guests, and admins.

- Colour-coded availability (available/booked/blocked).
- Minimum and maximum stay rules enforced.
- Seasonal pricing rules reflected on calendar.

13.x Guest Dashboard

Personal account area for travellers to manage bookings, itineraries, and preferences.

- Active and past bookings with status.
- AI-generated itineraries (saved and editable).
- Loyalty rewards balance.
- Personal preferences and profile settings.

13.x Reviews System

Two-way review system for guests and hosts post-stay.

- Guest reviews property (1–5 stars + written review).
- Host reviews guest (private; used for future booking decisions).
- Reviews published after both parties submit or after 7-day window expires.
- Review moderation by admin.

13.x Bike Rental

In-platform bike rental booking for guests at select properties.

- Availability by date and duration.
- Model selection (gearless, manual, electric).
- Delivery to property option.

13.x Membership & Rewards

Loyalty programme for repeat travellers.

- Points earned on bookings, experiences, and referrals.
- Tiered membership: Explorer, Dhyana Member, Elite.
- Points redeemable on future bookings.

■ AI Development Prompt — Current Platform Features

■ Objective

- Document, design, and implement all current DhyanaStays platform features to production-ready standard.
- Each feature must be fully functional, tested, and accessible before public platform launch.

■ Booking Engine — API Behavior

- GET /api/v1/properties/search — accepts destination, check_in, check_out, guests; returns paginated property list.
- GET /api/v1/properties/{id}/availability — returns available dates for a property.
- POST /api/v1/bookings — creates a booking; triggers payment initiation.
- POST /api/v1/payments/initiate — initiates payment via Razorpay; returns payment_url.
- POST /api/v1/payments/webhook — handles payment gateway webhook; confirms or cancels booking.

■ Reviews System — Business Rules

- Review window: 7 days post check-out; after expiry, neither party can submit.
- Minimum review length: 50 characters.
- Star rating: Required (1–5); written review: Required.

— Review moderation: Automated profanity filter + manual admin review queue for flagged content.

■ Security Requirements

— All payment data must be tokenised; no raw card data stored on DhyanaStays servers.

— User authentication: JWT with 24-hour expiry + refresh token (7-day rolling).

— All API endpoints must require authentication except public property search and listing pages.

— Rate limiting: 100 requests/minute per authenticated user; 20/minute for unauthenticated.

■ Success Scenario

— Guest completes a booking, receives confirmation, accesses Guest Dashboard, and leaves a review — all within the DhyanaStays platform without external tools.

14.1 Overview

This section documents all upcoming features planned for DhyanaStays in Phases 2 and 3 of platform development. These features expand the ecosystem beyond accommodation into a full travel lifestyle platform.

Phase 2 Features

Cloud Kitchen — In-house or partner cloud kitchen operations providing fresh, local meals to guests at DhyanaStays properties.

Event Booking — Discovery and ticketing for local festivals, cultural events, music nights, and community gatherings.

Workshop Booking — Booking platform for artisan workshops, cooking classes, yoga retreats, and wellness sessions.

Corporate Retreat Booking — Dedicated booking flow for corporate clients seeking retreat venues with customisable packages.

Wellness Programs — Curated wellness programmes (yoga, meditation, Ayurveda) bookable through the platform.

Travel Insurance — In-platform travel insurance purchase at checkout, powered by an insurance API partner.

Airport Pickup — Pre-scheduled airport transfer booking with driver tracking.

Taxi Booking — On-demand and scheduled cab booking within destination areas.

Rental Cars — Self-drive car rental options with in-platform booking and documentation verification.

Digital Check-in — Contactless check-in via QR code or app-based verification — no front desk required.

Phase 3 Features

Smart Locks — IoT-enabled smart lock integration allowing keyless entry via app or OTP.

IoT Room Integration — Smart home controls (lights, AC, fan) accessible through the guest app during stay.

Voice Controlled Rooms — Voice command integration with smart home devices for hands-free room control.

AI Concierge — Fully conversational AI concierge accessible 24/7 for guest requests, recommendations, and service calls.

Community Marketplace — Platform for local artisans, craftspeople, and vendors to sell products to guests.

Volunteer Marketplace — Connecting travellers with local volunteering opportunities — community-driven travel experiences.

Experience Marketplace — Open marketplace for verified experience providers to list and sell activities on DhyanaStays.

Emergency Medical Support — In-app emergency medical response coordination — connects guest with nearest medical facility and alerts property host.

Travel Wallet — Platform-native digital wallet for accumulating, storing, and spending DhyanaStays credits and rewards.

Carbon Footprint Tracker — Tracks and displays the environmental impact of each trip; offers carbon offset options.

Digital Travel Journal — In-app journal for guests to document, photo-log, and narrate their travel memories, with shareable links.

14.2 Feature Prioritisation Framework

Priority 1 (Must Have)	Booking Engine, AI Trip Planner, Investor Dashboard, Host Dashboard, Payments
Priority 2 (Should Have)	Event Booking, Transport, Food, Digital Check-in, Rewards
Priority 3 (Could Have)	Smart Locks, IoT, Voice Control, Carbon Tracker, Travel Wallet
Priority 4 (Future Vision)	AI Concierge, Volunteer Marketplace, Community Marketplace

■ AI Development Prompt — Upcoming Features — Smart Lock & IoT Integration

■ Objective

— Build a Smart Lock and IoT room integration module that enables keyless, app-controlled property access and room management for DhyanaStays guests.

■ Functional Requirements

- Smart Lock: Guest receives a time-limited digital key via the app upon check-in.
- Digital key is valid from check-in time to check-out time only.
- Guest can share temporary access with other guests in the booking.
- Property host can remotely lock/unlock and grant/revoke access.
- IoT Room Controls: Lights, AC, fan accessible via in-app panel.
- Room controls are available only when guest is checked in (geo-fenced or time-gated).

■ API Behavior

- POST /api/v1/smart-lock/grant — issues a digital key for a booking; integrates with lock hardware API (e.g., TTLock or Yale).
- DELETE /api/v1/smart-lock/revoke — revokes digital key on check-out.
- POST /api/v1/iot/control — sends room control command (light_on, ac_set_temp, fan_speed).

■ Security

- Digital keys must be cryptographically signed and time-limited.
- Lock hardware must use encrypted communication (BLE or Z-Wave).
- All IoT commands must be authenticated and rate-limited.
- Key compromise detection: If a key is used from an unexpected location, alert the host immediately.

■ Success Scenario

— Guest arrives at property → opens DhyanaStays app → taps "Unlock Door" → enters room → controls lights and AC via app → checks out → key automatically expires.

15.1 Overview

The DhyanaStays technology stack is designed for scalability, security, real-time performance, and AI integration. Every component is selected to support the platform's growth from 20 properties in Phase 1 to 300+ properties in Phase 3, with tens of thousands of concurrent users.

15.x AI Recommendation Engine

Powers personalised property recommendations, itinerary generation, and predictive travel planning. Built on an LLM foundation fine-tuned with local hospitality and travel data.

- Natural language understanding for search and trip planning queries.
- Collaborative filtering for property and experience recommendations.
- Reinforcement learning from user interaction (edits, bookings, ratings) for continuous improvement.
- Weather API integration for real-time and forecasted condition-based suggestions.

15.x Cloud Infrastructure

Scalable cloud deployment ensuring 99.9% uptime, global CDN delivery, and auto-scaling under load.

- Primary cloud provider: AWS or GCP (multi-region deployment).
- Auto-scaling for compute resources during peak booking windows.
- CDN for static assets and video content delivery.
- Object storage for property images, videos, and documents.

15.x Secure Payment Gateway

PCI-DSS compliant payment processing supporting all major Indian payment methods.

- Razorpay or PayU as primary payment gateway.
- UPI, credit/debit cards, net banking, and wallet support.
- Automated refund engine for cancellations.
- Webhook-based payment confirmation to ensure booking-payment consistency.

15.x Real-time Booking Engine

High-performance availability and reservation management system.

- Distributed locking mechanism to prevent double bookings.
- Real-time calendar sync with host dashboard.
- Support for instant booking and request-to-book flows.
- Webhook notifications for booking events (confirmation, cancellation, modification).

15.x Scalable Architecture

Microservices-based architecture ensuring independent deployment and scaling of each platform component.

- API Gateway for all client-to-server communication.
- Independent microservices: Booking, AI, Payments, User Management, Notifications, Reviews.
- Event-driven architecture using a message queue (RabbitMQ or Kafka) for asynchronous operations.
- Database: PostgreSQL for transactional data; Redis for caching; Elasticsearch for search.

15.x Analytics Dashboard

Business intelligence layer providing real-time and historical insights across all platform dimensions.

- Real-time booking, revenue, and occupancy metrics.
- User acquisition and conversion funnel analytics.
- AI model performance monitoring.
- Custom report builder for admin and investor users.

15.x API Integration

Third-party integrations extending platform capabilities.

- Google Maps API: Location search, property maps, route planning.
- OpenWeatherMap API: Weather data for AI trip planning.
- Twilio / AWS SNS: SMS and push notification delivery.
- Razorpay: Payment processing.
- TTPass / Yale: Smart lock integration (Phase 3).
- Google Calendar / iCal: Booking calendar sync for hosts.

15.2 Non-Functional Technical Requirements

API Response Time	< 200ms for read operations; < 500ms for write operations (p95)
Page Load Time	< 2.5 seconds (LCP) on 4G mobile connection
Uptime SLA	99.9% (less than 8.7 hours downtime per year)
Concurrent Users	Support 10,000 concurrent users at Phase 2; 50,000 at Phase 3
Data Backup	Automated daily backups; 30-day retention; point-in-time recovery capability

Security	OWASP Top 10 compliance; penetration testing before each major release
Accessibility	WCAG 2.1 Level AA compliance across all public-facing pages
Browser Support	Latest 2 versions of Chrome, Safari, Firefox, Edge; iOS Safari 14+; Android Chrome 90+

■ AI Development Prompt — Technology Stack

■ Objective

— Define and implement the DhyanaStays technology stack to support an AI-powered, scalable, secure hospitality platform.

■ Architecture Guidance

- Use a microservices architecture with an API Gateway as the single entry point for all client requests.
- Each service (Booking, AI, Payments, Users, Notifications) must be independently deployable.
- Use PostgreSQL as the primary database; Redis for session management and caching; Elasticsearch for property and experience search.
- All services communicate via REST API or message queue (Kafka/RabbitMQ) for async operations.

■ AI Service Requirements

- AI service must run as an isolated microservice with its own API contract.
- AI responses must be cached for identical requests (same inputs → same output cached for 1 hour).
- AI service must implement graceful degradation — if the LLM is unavailable, return rule-based recommendations.

■ Security Requirements

- All API endpoints must use HTTPS (TLS 1.3 minimum).
- JWT authentication with 24-hour access tokens and 7-day refresh tokens.
- Role-Based Access Control (RBAC): Guest, Host, Investor, Admin, Super Admin.
- PCI-DSS compliance for all payment data flows.
- No sensitive data (passwords, payment details) stored in logs.

■ Success Scenario

- Platform handles 10,000 concurrent users during a peak booking window with < 200ms API response times and zero double-booking incidents.

16.1 Overview

The DhyanaStays product roadmap defines three phases of growth, each with specific property targets, feature milestones, and market expansion goals. This document governs sprint planning, resource allocation, and investor communication.

Phase 1 — Foundation & Launch

Properties	20–30 curated units across select destinations
Booking Engine	Full booking engine with payment and confirmation
Investor Dashboard	Revenue and occupancy tracking for Phase 1 investors
Host Dashboard	Property management tools for property owners
Payment Integration	Razorpay integration with UPI, cards, and wallets
Basic AI	Prototype AI Trip Planner with limited destination coverage
Website	Full marketing and booking website launch
Mobile App	iOS and Android app (MVP — booking and guest journey)

Phase 2 — Ecosystem Expansion

Properties	100 units across 10+ destinations
AI Trip Planner	Full AI itinerary generation with all smart features
Events	Event discovery and ticketing integration
Transport	Taxi, bike rental, and airport transfer booking
Food	Restaurant discovery and ordering integration
Membership	Full loyalty programme with tiered rewards
Corporate Retreats	Dedicated corporate booking flow and packages
Digital Check-in	Contactless check-in via QR code

Phase 3 — Scale & Intelligence

Platform Properties	300 platform-managed units
Partner Properties	30 premium investor-partner units
AI Concierge	Fully conversational AI concierge (24/7)
Smart Tech	Smart locks, IoT room controls, voice assistant
Experience Marketplace	Open marketplace for experience providers

SaaS Licensing	Technology platform licensing to other hospitality operators
International Expansion	First destination outside India
Community Marketplace	Artisan and volunteer marketplace launch

■ AI Development Prompt — Product Roadmap

■ Objective

— Build a visual product roadmap section that communicates DhyanaStays's phased growth vision to investors, partners, and potential employees.

■ UI Expectations

- Three-phase horizontal timeline (desktop) or vertical accordion (mobile).
- Each phase: Header badge (Phase 1/2/3), title, and milestone list.
- Phase 1: Active/current — highlighted in gold or teal.
- Phase 2 & 3: Future — slightly muted with a "Coming Soon" indicator.
- Animated progress bar from Phase 1 to Phase 3.
- CTA after roadmap: "Be part of our Phase 1 launch" → Investor enquiry form.

■ Business Rules

- Roadmap milestones must accurately reflect the current development status.
- Completed milestones must be marked with a checkmark icon.
- Phase dates must not be included unless confirmed — avoid overpromising timelines.

■ Success Scenario

- An investor views the roadmap and clearly understands the growth trajectory and investment opportunity at each phase.

17.1 Social & Community Impact

■ Sustainable Tourism

DhyanaStays promotes responsible travel by partnering with properties that meet sustainability standards — eco-construction, water conservation, solar power, and waste management.

■ Employment Generation

Every DhyanaStays property and partner creates direct and indirect employment for local communities — hospitality staff, guides, drivers, artisans, and food vendors.

■ Local Business Support

The DhyanaStays ecosystem actively integrates local restaurants, shops, and experience providers into the platform — channelling traveller spend into local economies.

■ Rural Tourism Growth

By curating stays in rural, off-the-beaten-path destinations, DhyanaStays drives tourism revenue to regions that are typically bypassed by mainstream travel.

■ Architecture-Led Hospitality

DhyanaStays believes that beautiful, contextually sensitive architecture elevates the traveller experience and preserves the cultural identity of destinations.

■ Investor Wealth Creation

The 50:50 revenue sharing model creates a passive income stream for investors while funding the growth of the DhyanaStays ecosystem.

■ Community Development

DhyanaStays contributes a portion of platform revenue to local community development initiatives — education, healthcare access, and infrastructure.

17.2 Competitive Differentiators (Why Choose DhyanaStays?)

Differentiator	DhyanaStays	Traditional Booking Platforms
Curation	100% curated, quality-controlled stays	Open marketplace — quality varies widely
AI Features	AI Trip Planner, Smart Itinerary, AI Concierge	Basic search and filter only

Ecosystem	All-in-one: Stay + Food + Transport + Events + Accommodation only	Access to all
Architecture	Design-first properties with intentional aesthetic standards	High design standards
Investment Model	50:50 revenue sharing with full transparency	No investor participation model
Community	Local business integration as platform partner	No community engagement
Direct Booking	Platform-native direct booking — no OTA dependency	OTA dependent; high commission leakage
AI Personalisation	Learns from every interaction; improves over time	Generic recommendations
Transparency	Real-time financial dashboards for all stakeholders	No investor or host dashboards

■ AI Development Prompt — Social Impact & Competitive Differentiators

■ Objective

— Build an Impact section and a Differentiators section that reinforce DhyanaStays's purpose-driven positioning and market advantage.

■ UI Expectations — Impact

- 7 impact cards in a grid: Icon, bold title, 2-sentence description.
- Each card has a thematic colour accent (green for sustainability, blue for employment, etc.).
- A "Impact Counter" row: Animated number counters for projected jobs created, local businesses supported, carbon offset tonnes.

■ UI Expectations — Differentiators

- Comparison table: DhyanaStays vs. Traditional Booking Platforms.
- DhyanaStays column highlighted in teal with a "We Win" indicator (✓ icons).
- Mobile: Collapse table into card-per-differentiator with toggle to see comparison.

■ Business Rules

- Impact statistics must be labelled as "projected" or "target" until verified data is available.
- Differentiator claims must be factually accurate and not misleading.
- Sustainability claims must be backed by verifiable standards or self-certification.

■ Success Scenario

- A community-minded investor or traveller reads this section and feels confident that DhyanaStays aligns with their values and creates genuine positive impact.

19.1 Overview

The Statistics section presents DhyanaStays's key targets and platform metrics in a visually compelling, animated counter format. These figures communicate the scale, ambition, and trajectory of the platform to all stakeholder groups.

19.2 Platform KPIs

300+	Target Curated Properties	Phase 3 total platform-managed and partner properties
30	Premium Investor Partner Units	Properties developed in direct partnership with investors
100,000+	Target Users	Registered traveller accounts by end of Phase 3
50+	Hospitality Partners	Verified hospitality management and operations partners
100+	Local Experience Partners	Curated experience providers across all destinations
100%	Direct Booking Vision	Platform goal to eliminate OTA dependency entirely

19.3 KPI Definitions & Tracking Rules

Target Properties (300+)	Includes both platform-managed (DhyanaStays-operated) and partner-listed properties. Counted when property is live and bookable on the platform.
Premium Investor Units (30)	Properties developed in direct 50:50 investment partnership. Counted when investor agreement is signed and property is operational.
Target Users (100,000+)	Registered accounts with at least one completed booking. Not merely sign-up count.
Hospitality Partners (50+)	Verified third-party hospitality management organisations contracted with DhyanaStays.
Experience Partners (100+)	Verified experience providers with at least one live, bookable experience on the platform.

Direct Booking Vision (100%)

Percentage of bookings made directly through DhyanaStays (app or website) vs. OTA channels. Target is 100% direct.

■ AI Development Prompt — Statistics & KPI Counter Section

■ Objective

— Build an animated statistics counter section that visually presents DhyanaStays's platform ambition and key performance targets.

■ UI Expectations

- 6 statistic cards in a horizontal row (desktop) or 2×3 grid (mobile).
- Each card: Large animated number (counts up on scroll-enter), bold label, short description.
- Number animation: Count from 0 to target value over 2 seconds using easing (ease-out).
- Icon above each number: Thematic (property icon, user icon, partner handshake, etc.).
- Background: Dark navy or deep teal for visual impact; white text.

■ System Behavior

- In future: Connect statistics to a live analytics API so numbers reflect real-time platform data.
- For launch: Numbers are static targets displayed with a "Target" or "Goal" label.
- Intersection Observer triggers the count-up animation only when the section enters the viewport.

■ Business Rules

- All statistics must be labelled as targets or projections — never presented as achieved metrics unless verified.
- When real data is available, replace target values with live data from the analytics API.

■ Success Scenario

— User scrolls to the statistics section → numbers animate upward dramatically → user is impressed by the scale of the platform's ambition.

20.1 Join the Movement — CTA Module

The "Join the Movement" section is the primary conversion section of the DhyanaStays website. It presents three distinct audience pathways — Traveller, Investor, and Property Owner — and directs each to their relevant entry point.

20.2 Three CTA Cards

I'm a Traveller

Discover curated stays across India. Let AI plan your perfect journey.

Explore Stays

Links to property search page

I'm an Investor

Earn passive income through India's AI-powered hospitality ecosystem.

Register Interest

Opens investor enquiry form modal

I'm a Property Owner

Partner with DhyanaStays to transform your property into a premium stay.

Partner With Us

Opens property submission form

20.3 Business Rules — CTA Module

- Each card must clearly indicate the audience it is for — no ambiguity.
- CTA buttons must open a modal or navigate immediately — no loading delay.
- The three cards must always be displayed side-by-side on desktop (min. 1024px) and stacked on mobile.
- A/B testing should be implemented on the CTA copy to optimise conversion rates over time.

20.4 Contact Section

Contact Form Fields	Name, Email, Phone, Subject (Traveller / Investor / Property Owner / Other), Message, Submit
Form Validation	All fields mandatory; email format validation; phone (Indian format); message min 20 characters
Submission	POST to contact API; auto-reply email within 2 minutes; team response within 24 hours

Map	Embedded Google Map showing DhyanaStays office or primary operation area
Direct Links	Instagram, LinkedIn, YouTube (all open in new tab), Email (mailto link)

20.5 Footer — Navigation Structure

About	Invest	Partner	Platform	Legal
Mission	Investor Overview	Property Owners	Booking	Privacy Policy
Vision	Investment Model	Partner With Us	AI Trip Planner	Terms of Service
Team	Register Interest	Architecture Services	Experiences	Cookie Policy
Careers	FAQs	Hospitality	Events	Cancellation Policy
Press		Management	Transport	

20.6 Newsletter Subscription

- Email input field with "Subscribe" button inline.
- Double opt-in: Confirmation email sent before adding to mailing list.
- Subscription confirmation: Toast notification "You're subscribed! Welcome to the DhyanaStays community."
- Unsubscribe option: Available in every newsletter email footer.
- Data storage: Email addresses stored in a GDPR/PDPA-compliant manner with explicit consent recorded.

■ AI Development Prompt — Join the Movement, Contact & Footer

■ Objective

— Build the final conversion section (CTA cards), a contact form, and a structured footer that serves as the navigational and social hub of DhyanaStays.com.

■ UI Expectations — Join the Movement

— Three cards: Equal width, side-by-side (desktop), stacked (mobile).

— Card 1 (Traveller): Teal accent; nature/travel illustration or photo.

— Card 2 (Investor): Gold accent; wealth/growth illustration.

— Card 3 (Property Owner): Navy accent; architecture/property illustration.

— Each card: Headline, sub-text, primary CTA button, subtle background gradient.

— Hover effect: Card lifts (translateY -8px), shadow intensifies.

■ Contact Form — API Behavior

— POST /api/v1/contact — accepts name, email, phone, subject, message.

— Auto-reply: Send branded email template within 2 minutes of submission.

— Internal notification: Slack or email alert to DhyanaStays team.

— Rate limiting: Max 3 contact form submissions per IP per hour.

■ Newsletter — API Behavior

— POST /api/v1/newsletter/subscribe — accepts email; triggers double opt-in email.

— GET /api/v1/newsletter/confirm/{token} — confirms subscription.

— DELETE /api/v1/newsletter/unsubscribe — removes email from list.

■ Footer Requirements

— Copyright notice: "© 2024 DhyanaStays. All Rights Reserved." — updated dynamically each year.

- Social links: Open in new tab with rel="noopener noreferrer".
- All links must be keyboard-accessible with visible focus states.
- Footer must be identical in structure across Dark and Light modes.

22.1 Design System Requirements

■ Premium Luxury Feel

Every visual element must signal quality, intentionality, and premium positioning. No clip-art, no generic icons, no template layouts.

■ Fully Responsive

The website must function and look exceptional on all devices: mobile (320px–480px), tablet (768px–1024px), and desktop (1280px+).

■ Dark & Light Mode

Complete Dark and Light mode support with a user-controlled toggle. Mode preference stored in local storage. No UI elements should break or lose legibility in either mode.

■ Glassmorphism

Semi-transparent frosted-glass effect applied to navigation bar, cards, modals, and overlays. Must use `backdrop-filter: blur()` with appropriate fallback for unsupported browsers.

■ Smooth Scrolling

Native CSS smooth scrolling enabled globally. Anchor link navigation must animate smoothly to target sections.

■ Micro Interactions

Every interactive element (buttons, links, cards, inputs) must respond to user actions with subtle, purposeful animations. No static, flat interactions.

■ Parallax Animations

Key sections (Hero, Mission, Impact) must feature parallax scrolling effects for depth and cinematic quality.

■ Lottie Animations

Replace static icons with Lottie animations wherever appropriate — feature icons, loading states, empty states, and success confirmations.

■ Interactive Maps

Property locations displayed on interactive Google Maps or Mapbox maps. Map markers must be custom-branded.

■ Minimal Icons

Icons must be from a consistent, premium icon library (Heroicons, Phosphor, or custom SVG). No mixing of icon styles.

■ Modern Typography

Two-font system maximum: A premium display font for headlines and a clean sans-serif for body text. Font hierarchy strictly enforced.

■ 3D Illustrations

Selected sections use 3D or isometric illustrations to add depth and visual interest — particularly for the Ecosystem and Problem/Solution sections.

■ Cinematic Transitions

Page section transitions must feel like cuts in a film — not abrupt, not generic. Use GSAP ScrollTrigger or equivalent for scroll-driven animations.

■ Loading Animation

A branded loading animation must appear on initial page load. Must reflect DhyanaStays identity — not a generic spinner.

■ Apple-Style Presentation

Product features must be presented in the style of Apple's product pages: full-width, one concept per scroll, visually immersive, copy-light.

■ No Clutter

Every element on every page must serve a purpose. If it doesn't communicate, convert, or delight — it is removed.

22.2 Performance Standards

Lighthouse Score	Performance ≥ 90; Accessibility ≥ 95; Best Practices ≥ 95; SEO ≥ 95
Core Web Vitals	LCP < 2.5s; FID < 100ms; CLS < 0.1
Image Optimisation	All images served in WebP format with AVIF fallback; lazy-loaded below the fold
Video Optimisation	Hero video served via CDN; adaptive bitrate streaming; <5MB for initial buffer load
Font Loading	System font fallback during web font load; font-display: swap enforced
Code Splitting	JavaScript bundles split by route; critical CSS inlined; non-critical CSS deferred
Caching	Static assets cached for 1 year; API responses cached per endpoint specifications

22.3 Accessibility Standards

- WCAG 2.1 Level AA compliance across all public-facing pages.

- Minimum colour contrast ratio: 4.5:1 for normal text; 3:1 for large text.
- All images must have descriptive alt text (decorative images: alt="").
- All form inputs must have associated label elements.
- Keyboard navigation must work across all interactive elements.
- Focus indicators must be visible and meet WCAG 2.1 requirements.
- ARIA labels must be applied to all icon-only buttons and interactive SVGs.
- Reduce-motion media query must disable all non-essential animations.
- Skip navigation link must be available for keyboard and screen reader users.

■ AI Development Prompt — Website Design Requirements

■ Objective

- Implement a premium, fully responsive, accessible, and performant website design system for DhyanaStays.com.
- The design system must be scalable, maintainable, and consistent across all 21+ website sections.

■ Design Token Requirements

- Define a global design token file: colours (navy, gold, teal, grey scale), typography (font family, size scale, weight), spacing (4px base grid), border-radius, shadow levels.
- Tokens must be available as CSS custom properties (variables) and/or design system tokens (Figma/Storybook).
- Dark mode: Override colour tokens using prefers-color-scheme media query and a data-theme attribute toggle.

■ Animation Library

- GSAP (GreenSock) as the primary animation library for complex, scroll-driven sequences.
- Lottie-web for JSON-based vector animations.
- CSS transitions for micro-interactions (hover, focus, active states).
- Intersection Observer API for scroll-triggered section animations.

■ Component Library

- Build a reusable component library: Button (primary, secondary, tertiary), Card (property, experience, investor), Form (input, select, checkbox, radio), Modal, Toast notification, Navigation, Footer.
- All components must be documented with usage guidelines and prop specifications.
- Components must be theme-aware (Dark/Light mode).

■ Performance Budget

- Total page weight (initial load): < 2MB compressed.
- JavaScript bundle: < 400KB gzipped.
- CSS bundle: < 80KB gzipped.
- Hero video: < 5MB for first 5 seconds of playback.

■ Success Scenario

- DhyanaStays.com scores 90+ on all Lighthouse metrics and passes WCAG 2.1 AA audit on first release.

23.1 Security Requirements

- All data transmission must use HTTPS (TLS 1.3 minimum).
- JWT authentication with RSA-256 signing; access tokens expire in 24 hours; refresh tokens expire in 7 days.
- Role-Based Access Control (RBAC) enforced at API gateway level: Guest, Host, Investor, Admin, Super Admin.
- PCI-DSS Level 1 compliance for payment data; no raw card data stored on DhyanaStays servers.
- OWASP Top 10 vulnerabilities must be addressed before each production deployment.
- Penetration testing required before Phase 1 launch and each major platform release.
- Data encryption at rest: AES-256 for all user data, financial records, and personal information.
- SQL injection and XSS protection enforced on all API endpoints.
- Rate limiting on all public API endpoints: 100 requests/minute per authenticated user.
- CAPTCHA or invisible bot detection on all public-facing forms.

23.2 Privacy & Data Compliance

- Compliance with India's Digital Personal Data Protection Act (DPDPA) 2023.
- Explicit consent must be obtained before collecting any personal data.
- Users have the right to access, correct, and delete their personal data.
- Data minimisation: Only collect data that is necessary for the stated purpose.
- Data retention: Booking data retained for 7 years (tax compliance); personal data deleted within 30 days of account deletion request.
- Third-party data sharing must be disclosed in the Privacy Policy and governed by data processing agreements.
- Cookie consent banner must appear on first visit for all users.

23.3 Platform Availability & Disaster Recovery

Uptime SLA	99.9% (< 8.7 hours downtime/year)
Recovery Time Objective (RTO)	< 2 hours for critical services (booking, payments)
Recovery Point Objective (RPO)	< 1 hour data loss maximum
Backup Frequency	Daily full backup; hourly incremental; 30-day retention
Failover	Automatic failover to secondary region within 15 minutes of primary region failure
Monitoring	24/7 infrastructure and application monitoring with automated alerting

■ AI Development Prompt — Non-Functional Requirements

■ Objective

- Ensure DhyanaStays meets enterprise-grade security, privacy, and availability standards before public launch.

■ Security Implementation

- Implement API Gateway with built-in rate limiting, JWT validation, and RBAC enforcement.
- Deploy WAF (Web Application Firewall) in front of all public endpoints.
- Implement OWASP ZAP or equivalent automated security scanning in the CI/CD pipeline.
- Store secrets (API keys, database credentials) in a secrets manager (AWS Secrets Manager or HashiCorp Vault).

■ Privacy Implementation

- Implement a consent management platform (CMP) for cookie consent.
- Build a "My Data" section in the user account for DPDPA compliance: View, Download, and Delete.
- Log all consent events with timestamp and user ID for audit purposes.

■ Monitoring & Alerting

- Deploy application performance monitoring (Datadog, New Relic, or equivalent).
- Set alerts for: API error rate > 1%; latency > 500ms (p95); payment failure rate > 2%; server CPU > 80%.
- Maintain a public-facing status page (statuspage.io or equivalent).

25.1 Glossary of Terms

AI Trip Planner	The DhyanaStays AI engine that generates personalised, day-by-day travel itineraries based on user inputs, local data, and contextual intelligence.
Curated Stay	A property that has been individually assessed, approved, and quality-controlled by DhyanaStays before being listed on the platform.
Ecosystem	The interconnected network of travellers, investors, property owners, experience providers, local businesses, and communities within the DhyanaStays platform.
Host Dashboard	The self-service property management interface available to property owners listed on DhyanaStays.
Investor Dashboard	The financial and performance analytics portal available to DhyanaStays investors.
LLM	Large Language Model — the AI architecture powering DhyanaStays's trip planner, chatbot, and recommendation features.
OTA	Online Travel Agency (e.g., MakeMyTrip, Booking.com) — third-party platforms that DhyanaStays aims to replace with direct booking.
PRD	Product Requirements Document — this document, which defines the complete functional and non-functional requirements of the DhyanaStays platform.
RBAC	Role-Based Access Control — a security model that restricts platform access based on the user's assigned role.
RevPAR	Revenue Per Available Room — a key hospitality metric calculated as (Total Revenue ÷ Total Available Room Nights).
SaaS	Software as a Service — the future DhyanaStays licensing model where the platform technology is offered to third-party operators.
SOS	Emergency support feature within the DhyanaStays app providing one-tap access to emergency contacts.
WCAG	Web Content Accessibility Guidelines — the international standard for web accessibility compliance.
50:50 Model	The DhyanaStays investor revenue sharing model where 50% of property revenue goes to the investor and 50% to DhyanaStays for operations and platform fees.

25.2 Document Change Log

Version	Date	Author	Changes
1.0	27 Jun 2026	DhyanaStays Product Team	Initial enhanced PRD — all sections documented with functional re

This document is the complete Product Requirements Document and AI Prompt Specification for DhyanaStays. It is intended to serve as the single source of truth for all design, development, and product decisions. All sections must be reviewed and approved by the DhyanaStays Product Lead before implementation begins. This document should be versioned and updated as the platform evolves.
